

Editor's Note:

The world's eyes are once again on China as the annual sessions of the National People's Congress (NPC) and the Chinese People's Political Consultative Conference (CPPCC), collectively known as the two sessions, opened on March 4.

In this issue, Science and Technology Daily speaks with foreign experts and young scientists working in China, who share their perspectives on China's scitech achievements. They also discuss China's open and inclusive research environment, its people-centered policies and the broader implications of its technological progress for the international community.

Steering a Greener Future

On November 14, 2024, China achieved a historic milestone as its annual production of new energy vehicles (NEVs) surpassed 10 million units, consolidating its leading role in the transition to a greener future. This achievement shows not just China's technological progress but also its efforts to combat climate change and reduce carbon emissions.

A benchmark for the world

Nicholas Mulei Musyoka is an associate professor in renewable energy and energy storage at the Nottingham Ningbo China Beacons of Excellence Research and Innovation Institute, which is a part of University of Nottingham Ningbo China. He described China's NEV industry as "innovative, scalable and impactful" in a recent interview with *Science and Technology Daily*. Musyoka emphasized that the rapid adoption of NEVs in China is a clear indicator of the country's leadership in the sector.

"China is setting the trend and becoming a benchmark for other countries to follow," Musyoka said. But China's booming NEV industry is not just about numbers. According to Italian scientist Francesco Faiola, the rapid expansion of electric vehicles (EVs) has significantly improved people's quality of life.

"Chinese companies have made EVs more affordable and accessible, contributing to reduced air pollution and lower greenhouse gas emissions," Faiola said. Electric buses and taxis have become the norm, leading to cleaner air and improved public health.

This sentiment was echoed by Musyoka. "China does not live in a

bubble. China's contribution to reductions in CO₂ emissions benefits the entire planet," he said.

Instead of viewing China's advancements in the NEV industry as competition, Musyoka urged for more international collaboration. "China's progress should be applauded, and we should learn from its technological and adoption strategies. The bigger picture is about solving the climate crisis together."

A holistic approach to sustainability

China's rapid NEV adoption is not an isolated phenomenon but part of a broad, integrated strategy for sustainable development. Beyond reducing

able development. Beyond reducing emissions, it has triggered advancements in renewable energy, AI and smart city systems, transforming urban infrastructure.

However, NEVs are just one piece of the puzzle, as Musyoka pointed out. "To fully realize their potential, we need renewable energy installations to charge these vehicles, ensuring zero emissions throughout the lifecycle."

This holistic approach extends beyond land transportation. In sectors like maritime transport and aviation, China is exploring technologies such as power-to-methanol and sustainable aviation fuels to further cut carbon emissions.

Additionally, innovations in battery technology are enhancing the efficiency of unmanned aerial vehicles, contributing to greener logistics and transportation networks. "The integration of AI and smart systems ensures efficient monitoring and management, making cities cleaner and more sustainable," Musyoka added.

China's AI Rise Benefits the World

With its rapid advancements in AI, China is consistently capturing world headlines, not only for its technological progress but also for the profound impact these advancements are having on society and the world. Through the eyes of international experts and researchers, we gain a deeper understanding of China's AI journey, showing its forward-thinking policies, commitment to improving quality of life, and growing influence on the global stage.

AI for common good

China's strategic focus on AI as a key driver of economic and social progress has been a paradigm shifter. The country's policymakers have demonstrated remarkable foresight by identifying AI as a critical area for development and setting a goal to become a global leader in the field by 2030. This vision is backed by substantial investments in research, development, and implementation across various sectors.

Sergey V. Ablameyko, an academician of the National Academy of Sciences of Belarus and visiting professor at Northwestern Polytechnical University in Xi'an, said that, "China has made significant progress in the AI field, especially since 2017 when it adopted a national strategy for AI development. I have seen how China has grown in this area over the past 20 years, and it is now a leader in both practical applications and scientific research."

However, what China has done goes far beyond this. According to Ashyana- Jasmine Kachra from the London School of Economics and Political Science, "China is not just focused on the proliferation of AI and its innovative use cases; the country has also been silently leading the pack and making its mark on the AI regulatory landscape."

China has implemented strict laws and ethical guidelines for AI development, ensuring that technological advancements align with societal values.

In 2017, China released the Next Generation Artificial Intelligence Development Plan to encourage diverse AI methodologies, such as deep learning, knowledge- based reasoning and largescale modeling. In May 2019, it was followed by the Beijing AI Principles, which set out clear guidelines for AI research and development, advocating respect for privacy, human dignity and human rights. This underscores China's commitment to developing responsible AI and its philosophy of using technology for the greater good.

Profound global influence

China's AI advancements are not confined to within its borders; they are shaping the global landscape of technology and innovation.

Md Monjurul Karim, a young Bangladeshi researcher majoring in AI at the Shenzhen Institutes of Advanced Technology, Chinese Academy of Sciences, emphasized how China's rapid progress in AI has influenced his career and research. He noted that China's AI ecosystem, with its high-performance computing infrastructure and top-tier research labs, provides an ideal environment for cutting-edge research.

Breakthroughs like DeepSeek, a large-scale AI model, have inspired new ways of thinking and accelerated innovation. For Karim, AI is not just a tool but a "research companion" that fosters creativity and exploration.

China's focus on innovation is also driving global advancements in AI and computer science. Karim pointed out that China's investments in large-scale AI models and high-performance computing contribute to the broader research community, enabling international collaboration and knowledge-sharing.

One of the most significant contributions of China's AI industry is its commitment to "democratizing access to AI technologies," said Md Altab Hossin, a Bangladeshi expert at the School of Innovation and Entrepreneurship, Chengdu University, adding that DeepSeek exemplifies this ethos. By developing easytouse models, tools and platforms, DeepSeek has made AI accessible to users without extensive technical expertise. Its open-source model allows anyone to use it for professional or personal purposes without restrictions.

Just as Ablameyko noted, China's progress is an opportunity for the world, and its development in science is a help, not a threat to the global community.

marks a significant advancement in maize biofortification.

partnerships.

technologies.

This achievement is largely due to

The open and inclusive nature of China's research ecosystem is clear in Danyal's daily work, as he collaborates with colleagues from around the world. "We are working together to tackle pressing agricultural challenges such as micronutrient deficiency," he said.

Muhammad Adeel Qureshi, a senior researcher from Pakistan, speaks highly of the organization and systematic approach to China's agricultural programs. He noted that China is a leading producer of wheat worldwide. "This high yields resulted due to the continuous efforts by the breeders and scientists across China. I'm honored to be part of the CAAS, where the breeding work is systematic and well organized," said Qureshi, adding that the research team of his lab has developed many molecular markers for different quality traits in wheat.

For him, being part of such a well-organized environment has been both enriching and motivating. He noted that China focuses on international cooperation at both governmental and institutional levels, which is crucial for tackling global agricultural challenges. "China's policies on collaboration are reflected at both the governmental and individual levels, with a strong focus on international cooperation, especially in the scientific community," Qureshi said.

Connecting continents, empowering research

The BRI has proven to be a vital platform for expanding international collaboration in agriculture. Yirga Kindie Wasihun, a senior researcher from Ethiopia doing his PhD in wheat genetics and molecular breeding in CAAS, underscores the impact of this initiative on global agricultural cooperation. "The BRI has not only provided infrastructure but also opened doors for knowledge transfer, allowing us to bring back new technologies to our home countries," said Wasihun. Through the BRI, China is actively collaborating with partner countries, facilitating agricultural research and fostering capacity building. "China plays a leading role in uplifting the region's economies and ensuring sustainable development," said Wasihun.

Qureshi also recognizes the BRI's pivotal role in boosting agricultural collaboration. "The BRI has created numerous opportunities in infrastructure, science, technology and other fields," he said. "It has opened doors for international students and scientists, fostering collaboration and knowledge exchange."

578, a strong gluten wheat variety currently widely grown by farmers."
